Please cancel the current Abstract found on page 55, 4-15, and insert the following new Abstract:

The present invention includes a system and method for facilitating the patent preparation and filing process. Embodiments include a smart electronic invention disclosure form to be filled out on a client. A server receives a filled-out invention disclosure in electronic form. The completed smart disclosure form may be converted to a patent application by placing information from pre-selected fields in the invention disclosure form to pre-selected locations in the patent application. The patent application may be filed electronically at the patent office and such filing may trigger automatic calendaring of various reminders and deadlines. Embodiments of the present invention also include using invention disclosure data for analysis.
